

AME 525: Engineering Analysis I
Prof. P.K. Newton, RRB 221, 740-7782 (newton@usc.edu)
Fall 2016
Time: MW 5:00-6:20
Office Hours: TBA
TA & Grader: TBA

The course will cover techniques from linear algebra, vector analysis, and complex variable theory.

Grading:

- Homework 20 %
- Midterm (TBA) 35 %
- Final (Wed Dec. 7th 4:30-6:30) 45 %
- No exceptions/extensions will be made on Midterm or Final Exams

Books:

Advanced Engineering Mathematics, Peter V. O'Neil (Most recent Edition)

Lecture Outline:

1. Finite dimensional vector spaces and linear algebra
 - (a) Basic concepts of linear vector spaces
 - (b) Eigenvalues and eigenvectors
 - (c) Solving $Ax = b$: The Fredholm alternative
 - (d) Least squares methods
 - (e) Diagonalization and spectral decomposition
 - (f) Singular values

2. Vector analysis

- (a) Line integrals in the plane
- (b) Green's theorem in the plane
- (c) Path independence
- (d) Multiply connected domains
- (e) Line integrals in space
- (f) Gauss' divergence theorem
- (g) Green's identities
- (h) Stokes theorem

3. Complex variable theory

- (a) Basic concepts
- (b) Analytic functions and the Cauchy-Riemann equations
- (c) $x = f(z)$ as a mapping
- (d) Derivatives
- (e) Cauchy-Riemann equations
- (f) Harmonic functions
- (g) Integrals of complex functions
- (h) Contour integrals
- (i) Cauchy-Goursat theorem
- (j) Cauchy integral formula
- (k) Residue theory
- (l) Conformal mapping and 2D inviscid flows
