

EE 559 Machine Learning I: Supervised Methods Units: 4

Lecture: MW 3:30 – 5:20 PM Pacific Time Discussion: Thu 5:30 – 6:20 PM Pacific Time

Location: OHE 122, online, and DEN@Viterbi

Course URL: <u>https://courses.uscden.net/d2l/home</u>

Instructor: B. Keith Jenkins

Office Hours: TBA Contact Info: Email: jenkins@sipi.usc.edu [Please include "EE 559" in the subject line] Online: piazza.com

Teaching Assistants: TBA

**IT Help:** For help with coding machine-learning algorithms, consult piazza, online forums, or the TAs; for help with other python coding, working with datasets, or using library routines in python, also try online help and documentation, and reference resources given below; for help with USC-supplied software or on-campus networking, consult USC ITS at <a href="https://itservices.usc.edu/contact/">https://itservices.usc.edu/contact/</a>.

# **Course Description (Catalogue)**

Distribution-free and probabilistic methods for supervised classification and regression; learning algorithms; optimization techniques; feature-space transformations; parametric and nonparametric methods; Bayes decision theory; artificial neural networks.

# **Course Description (Expanded)**

Concepts and algorithms for pattern recognition and regression using machine learning are covered in depth. The course will stress an understanding of different supervised-learning algorithms at both theoretical and practical levels, as well as their advantages and disadvantages. Underlying fundamentals are emphasized, including theory and origins of learning algorithms and criterion functions. The goal is to give the student an understanding of some fundamental approaches to machine learning, to enable further study and growth on their own. The student's work will include mathematical analysis, analytical understanding, and writing and running code that learns from data. A moderately sized project in the second half of the semester will involve developing and optimizing one or more machine learning systems to perform well on real-world datasets. This course is intended for graduate students in Electrical and Computer Engineering or related fields, who wish to gain an understanding of, and some experience with, machine learning approaches, tools, and techniques. Only supervised-learning methods are covered in this course.

## Learning Objectives

After successfully completing this course, the student will:

- Have a perspective of different approaches to supervised machine learning for pattern classification and regression
- Understand the underlying math of a variety of supervised-learning methods
- Be able to use statistical and non-statistical techniques to solve machine learning problems
- Be able to code and run algorithms for learning from data
- Be able to optimize machine learning algorithms and systems, and assess their overall performance
- Know how to create new techniques for machine learning where needed

# Prerequisite(s):

**Co-Requisite(s):** EE 503 and EE 510

## **Concurrent Enrollment:**

**Recommended Preparation**: knowledge of python (e.g., at the level of EE 541), knowledge of multivariate calculus (at the sophomore or junior undergraduate level). For students that don't know python, resources will be provided to help them learn python during the first few weeks of the semester, leveraging from their knowledge of MATLAB; students should allow some extra time for this if they don't know much python.

## **Course Notes**

The Desire2Learn (D2L) system will host the course website. On the website will be posted video recordings of the lectures and discussion sessions, lecture and discussion-session notes, additional instructor-provided notes and handouts, assignments and solutions. Your graded assignments and scores will also be visible to you on the website.

## Technological Proficiency and Hardware/Software Required

Python will be used throughout this class for homework assignments and the class project. All students will be responsible for installing and maintaining their own python distribution.

# **Required Readings and Supplementary Materials**

## **Required text**

• C. M. Bishop, *Pattern Recognition and Machine Learning* (Springer, 2006). ISBN-13: 978-0387-31073-2. Available from USC bookstore, Amazon.com, and Springer.com.

## Supplementary texts

- Kevin Murphy, *Probabilistic Machine Learning: An Introduction* (MIT Press, 2022). Preprint available for download at <u>https://probml.github.io/pml-book/book1.html</u>.
- R. O. Duda, P. E. Hart, and D. G. Stork, *Pattern Classification*, Second Edition (Wiley-Interscience, John Wiley and Sons, Inc., New York, 2001)
- T. Hastie, R. Tibshirani, and J. Friedman, *The Elements of Statistical Learning: Data Mining,* Inference, and Prediction, Second Edition (Springer, 2009)
- Simon Haykin, Neural Networks and Learning Machines, 3rd Edition, (Pearson, 2009)
- Ethem Alpaydin, Introduction to Machine Learning, Fourth Edition (MIT Press, 2020)
- I. Goodfellow, Y. Bengio, and A. Clourville, *Deep Learning* (MIT Press, 2016)

### Supplementary resources for Python

- Hans Fanghor, Introduction to Python for Computational Science and Engineering (2016) [PCSE], available for free download at: https://github.com/fangohr/introduction-to-python-for-computational-science-and-engineering
- Fabio Nelli, *Python Data Analytics*, (APress, 2015) [PDA], available for download from USC Library: <u>http://usc.summon.serialssolutions.com/search?q=Fabio%20Nelli%2C%20Python%20Data%20Analytics#!/search?ho=t&l=en&q=Fabio%20Nelli,%20Python%20Data%20Analytics</u>

## **Description and Assessment of Assignments**

#### 1. Homework assignments

Homework assignments will, on average, consist of approximately 50% computer problems and 50% analytical problems. Homework assignments will be posted on the course website when assigned, and typically due 1 week later (due date and time will be specified on the homework assignment). Each homework assignment will be worth 10 points. Starting with Homework 3, a portion of the homework score (1-2 points, depending on the amount and complexity of coding that is needed) for each homework assignment that includes coding will be based on quality of Python code that the student has written. (Guidelines for writing quality code will be given in discussion session as well as a handout on the course website.)

Python 3 is required for all homework computer problems, with the exception of the first 2 homework assignments, for which you are also allowed to use MATLAB. Some of the computer problems will require coding machine learning algorithms yourself (without using libraries such as pandas, sk-learn, etc.); others will allow use of these and other libraries. Each assignment will state the requirements and guidelines for its computer problems.

Python 3 is open source and available for free download (*e.g.*, as a distribution like <u>www.anaconda.com</u>).

#### 2. Midterm assignment

In place of a midterm exam, we will have a midterm assignment. It will be a 1-week take-home assignment, covering material from the first half of the semester (exact end point to be announced). It will include both computer problems and theory (pen and paper) problems. Each student must do their own work; complete ground rules will be posted before the assignment period begins.

## 3. Course project

*Programming languages:* For the course project, you may use python 3 and/or C/C++. If you want to use any other language for portions of your project, please check with the instructor or TA first.

*Typical project content (exact content to be determined):* You will be given a choice of 2-3 real-world datasets and associated nontrivial problems to solve. Your goal is to design and demonstrate a good-performing machine learning system, to compare some different approaches, and to understand and explain the results you obtain. To do so, you will use your choice of preprocessing, feature extraction, dimensionality adjustment, and classifiers/regressors, etc., to solve the problem; as well as cross validation, training and test datasets as appropriate. You will be given some guidelines and suggestions, as well as some requirements of items your project must include.

*Deliverables:* On or before the due date specified in the Project Assignment, you will turn in your project by uploading 3 files to the D2L website: (1) a written final report (as a pdf file); (2) a single, computer-readable pdf file with all of your code; and (3) a zip file that contains all your code files (e.g., .py files) in a form that can be run to verify your results. The written final report must be typewritten and include tables and graphs to show your final results as well as sample or summary intermediate results. The suggested and maximum length will be given in the project assignment. Detailed instructions for the written final report will be posted along with a template in Word and LaTeX.

Sample project (from a previous semester): You are given a Hand Postures dataset that consists of frames taken from videos of different hand gestures. The acquired data consists of locations of markers on a glove worn by each subject. The dataset is challenging because: (1) the markers are not labelled, so it is not known which data entry corresponds to which marker; (2) typically some of the markers are occluded in any given frame (image); and (3) the number of features varies from one data point (one frame) to another. Your goal is to design and demonstrate a pattern recognition system that can reliably recognize the hand posture, given input data from a separate test set. Your project is required to include a trial of at least 4 classifiers/learning algorithms (some of which are specified, some of which are up to you); feature dimensionality adjustment; any necessary preprocessing; proper dataset usage including cross validation and model selection; estimate of your final system's performance on unseen data; analysis, explanation, and demonstration that you understand intermediate and final results.

*Participants:* Each project can be done by a team of 2 students, or by an individual student. Guidelines will be provided in the Project Assignment as to as to which datasets and problems constitute a reasonable topic and workload for a team project and for an individual project.

Timeline (tentative):

- Week 11: Project Assignment, and Dataset Descriptions, posted on D2L
- Week 15: Final Report and code files due.

There are no progress reports or proposals required. However, the instructor and TAs are available for any discussions or questions that you would find helpful; and you are encouraged to seek advice or direction as you deem appropriate for your project.

Your course project will be graded by the following criteria (tentative):

- Technical approach (20%);
- Analysis, understanding, and interpretation (20%);

- Performance of your final system (15%);
- Workload (15%);
- Difficulty of the problem (10%);
- Quality of final report write-up (10%),
- Quality of written code (10%).

# **Course Grading Breakdown (tentative)**

Assessment Tool (assignments)	% of Grade
Homework	25
Course project	25
Midterm assignment	25
Final quiz	20
Online participation	5
TOTAL	100

Extra credit homework problems (throughout the semester) will be tallied separately from the above scores, and will determine students' grades for borderline cases (*i.e.*, students near a border between two letter grades).

# **Assignment Submission Policy**

Submit your homework by uploading one pdf file of your solution, and one computer-readable pdf file of all your code (for assignments with computer problems), to the Assignment Dropbox on the D2L website. A computer-readable pdf can be generated by converting an editable text document to pdf; scanned documents and screen-shots are not computer readable.

Due date and time will be stated on each homework assignment. The late submission policy will be posted on the D2L web site. Late penalties will be uniformly applied to everyone. In leiu of requesting extensions from the professor or TAs, everyone's lowest homework score will be dropped to accommodate special circumstances. Exceptions will only be granted for emergency situations (e.g., documented medical emergencies).

# **Grading Timeline**

Graded assignments including comments will be available on the D2L website as soon as grading is completed and verified (typically 1-2 weeks after the due date).

# Additional Policies

#### Policy on Collaboration and Individual Work in this Class

Collaboration on techniques for solving homework assignments and computer problems is allowed, and can be helpful; however, each student is expected to work out, code, and write up his or her own solution. Use of other solutions to homework assignments or computer problems, from any source including other students, before the assignment is turned in, is not permitted.

For class projects, general collaboration to resolve issues, or to clarify technical material, is allowed. Use of internet as well as journal and conference literature is encouraged. However, each student (or team) does their own work and writes up their own report. The author(s) of the report are presenting themselves as having done the work described in the report. Any reported work, explanations, information, or code that is obtained from others must be cited as such; instructions for doing this will be given with the project assignment. Including such work in the report or code without citing it amounts to plagiarism.

Please also see below (last 2 pages of syllabus) for additional policies that apply to all USC classes.

# **Course outline** (summary version)

- > Order of topics covered will be slightly different than the order presented below
- > Abbreviations: ML: machine learning; ANN: artificial neural networks
- 1. Course introduction
  - Basic concepts, ML paradigm, fundamental assumptions
- 2. Preliminaries
  - Discriminant functions; methods for mutlclass classification
  - Computational complexity
  - Convex functions
  - Fundamental assumptions
  - The learning problem
  - Criterion (objective) functions
  - Approaches to optimization
- 3. Learning and optimization 1
  - Gradient descent methods
  - Perceptron learning and convergence proof
  - Mean-squared-error algorithms for regression and classification
- 4. Nonlinear approaches for regression and classification
  - Nonlinear transformation by basis functions
  - Nonlinear transformation by kernel functions
- 5. Complexity in machine learning
  - Degrees of freedom and constraints
  - Regularization
  - Introduction to VC dimension
- 6. Learning and optimization 2
  - Optimization with constraints: Lagrangian techniques
  - Kernels and kernel methods
  - Support vector machines for classification
  - Support vector machines for regression
- 7. Validation and error estimation
  - Dataset usage: training, validation, test sets
  - Model selection and cross validation
- 8. Artificial neural networks 1
  - Single layer and multiple layer feedforward networks
  - Interpretations and capabilities
  - Learning algorithms
- 9. Artificial neural networks 2
  - ANNs as universal function approximators (proof by construction)

- Example: radial basis function networks
- Degrees of freedom and complexity in ANN
- 10. Feature selection and dimensionality reduction
  - Principal Components Analysis
  - Other linear transformations for 2-class and multiclass problems
- 11. Bayes decision theory for classification
  - Theoretically optimal probabililstic classification (minimum error and minimum risk criteria)
- 12. Density estimation techniques for classification
  - Mathematical approach and convergence
  - Kernel density estimation and k-nearest neighbors estimation
  - Discriminative and generative approaches
- 13. Density estimation techniques for regression
  - Theoretically optimal probabilistic MSE regression
  - k-nearest neighbors regression
  - Computational complexity and speed-up techniques (regression and classification)
- 14. Parametric estimation techniques (as time permits)
  - For classification
  - For regression
- 15. Conclusion and summary
  - Relation of topics to each other
  - ML key elements in the design phase, learning phase, and prediction phase

# Statement on Academic Conduct and Support Systems

#### Academic Conduct:

Plagiarism – presenting someone else's ideas as your own, either verbatim or recast in your own words – is a serious academic offense with serious consequences. Please familiarize yourself with the discussion of plagiarism in SCampus in Part B, Section 11, "Behavior Violating University Standards" policy.usc.edu/scampus-part-b. Other forms of academic dishonesty are equally unacceptable. See additional information in SCampus and university policies on scientific misconduct, policy.usc.edu/scientific-misconduct.

### Support Systems:

Counseling and Mental Health - (213) 740-9355 – 24/7 on call studenthealth.usc.edu/counseling

Free and confidential mental health treatment for students, including short-term psychotherapy, group counseling, stress fitness workshops, and crisis intervention.

# National Suicide Prevention Lifeline - 1 (800) 273-8255 – 24/7 on call suicidepreventionlifeline.org

Free and confidential emotional support to people in suicidal crisis or emotional distress 24 hours a day, 7 days a week.

Relationship and Sexual Violence Prevention Services (RSVP) - (213) 740-9355(WELL), press "0" after hours – 24/7 on call

#### studenthealth.usc.edu/sexual-assault

Free and confidential therapy services, workshops, and training for situations related to gender-based harm.

### Office of Equity and Diversity (OED) - (213) 740-5086 | Title IX – (213) 821-8298 equity.usc.edu, titleix.usc.edu

Information about how to get help or help someone affected by harassment or discrimination, rights of protected classes, reporting options, and additional resources for students, faculty, staff, visitors, and applicants.

#### Reporting Incidents of Bias or Harassment - (213) 740-5086 or (213) 821-8298 usc-advocate.symplicity.com/care\_report

Avenue to report incidents of bias, hate crimes, and microaggressions to the Office of Equity and Diversity |Title IX for appropriate investigation, supportive measures, and response.

#### The Office of Disability Services and Programs - (213) 740-0776 dsp.usc.edu

Support and accommodations for students with disabilities. Services include assistance in providing readers/notetakers/interpreters, special accommodations for test taking needs, assistance with architectural barriers, assistive technology, and support for individual needs.

USC Campus Support and Intervention - (213) 821-4710 campussupport.usc.edu

Assists students and families in resolving complex personal, financial, and academic issues adversely affecting their success as a student.

Diversity at USC - (213) 740-2101

#### diversity.usc.edu

Information on events, programs and training, the Provost's Diversity and Inclusion Council, Diversity Liaisons for each academic school, chronology, participation, and various resources for students.

*USC Emergency - UPC: (213) 740-4321, HSC: (323) 442-1000 – 24/7 on call* <u>dps.usc.edu</u>, <u>emergency.usc.edu</u>

Emergency assistance and avenue to report a crime. Latest updates regarding safety, including ways in which instruction will be continued if an officially declared emergency makes travel to campus infeasible.

USC Department of Public Safety - UPC: (213) 740-6000, HSC: (323) 442-120 – 24/7 on call dps.usc.edu Non-emergency assistance or information.
