

Methods of Applied Mathematics

MATH 570a

Text: Linear Operator Theory in Science and Engineering, by
A. W. Naylor and G. R. Sell

The techniques of this course provide a powerful framework for analyzing infinite dimensional problems arising in virtually every modeling problem in Applied Mathematics and the Physical Sciences in the broadest sense. The course is intended to serve primarily students of the Applied Sciences: Economics, Engineering, Physics and Applied Mathematics Majors.

Professor: Robert Sacker

Office: KAP 438-A, (213)740-3793

Office hours: To be announced

E-mail: rsacker@usc.edu

With the Covid situation, the course will most likely be taught on line.

GRADING POLICY

2 Midterm exams – 40% of grade

Homework – 40%

Final – 20%

Class Schedule

Weeks		Chapter
1 - 3	Metric spaces, subspaces and product spaces, open and closed sets, convergence and equivalent metrics	3A
4 – 5	Countability, compactness, completeness and completions, contraction mapping theorem, integral equations	3B
6 - 7	Linear spaces, Hamel basis and dimension, function spaces, linear transformations, isometries, inverse transformations, Office hours: To be announced hyperplanes, conjugate space,	4
8 – 9	With the Covid situation, the course will most likely be taught on line. operators, closed operators, complementary subspaces, dual spaces	5A
10 -11	Inner product and Hilbert spaces, orthonormal basis, generalized Fourier series	5B
12 -13	Continuous linear functionals, Fourier transform pair, unitary operators Homework – 40%	5B
14 -15	Final – 20% operators, Heisenberg uncertainty principle	12 & 13
