This course will not have any formal prescribed texts. Material from the following suggested books will be used from time to time.

Exams: Dates TBD

Grade: 2 Midterm Tests (40%), Final Term Paper on selected topics (40%), Occasional problem sets (20%).

Syllabus: Outline of the material that will be covered.

- Introduction to Nuclear Magnetic Resonance (NMR) Spectroscopy
- Physical Aspects of NMR and Basic Theory- Single Pulse Experiment
- FT NMR
- Experimental Aspects
- $^1$H NMR spectra of Organic Molecules
- $^1$H NMR Chemical Shifts and Spin-Spin Coupling Constants
- Origin of Chemical Shifts and Coupling Constants
- $^{13}C$ and $^{19}F$ NMR Spectroscopy
- Spin Decoupling
- NMR of Other Nuclei
- Dynamic NMR
- CIDNP
- Multiple Pulse Experiments
- Polarization Transfer
- Spectral Editing
- Connectivity through Bonds, Space and Chemical Exchange
- Two Dimensional NMR
- NMR of Solids
- Imaging
- Theoretical Methods (IGLO, GIAO)
NMR Bibliography

"NMR Basic Principles and Progress", Springer Verlag, Volumes 1-33. Each volume is dedicated to a particular nucleus or technique.
